Test Performed
Sequence analysis and deletion/duplication testing of the 300 genes listed in the results section below.

Reason for Testing
Partner is a known carrier

INVITAE CARRIER SCREEN RESULTS

About this test

This carrier test evaluated 300 genes for genetic changes (variants) that are associated with an increased risk of having a child with a genetic disorder. Knowing you are a carrier for one of these disorders may provide information that can be used to assist with family planning and/or preparation.

Result

POSITIVE

Summary

This test shows the presence of clinically significant genetic change(s) in this individual in the gene(s) indicated below. No other clinically significant changes were identified in the remaining genes evaluated with this test.

Results	Gene	Variant(s)	Inheritance	Partner testing recommended
CARRIER: Cystic fibrosis	CFTR	c.1521_1523delCTT (p.Phe508del)	Autosomal recessive	Yes

Next steps

- See the table above for recommendations regarding testing of this individual's reproductive partner.
- Even after a negative test result, there is always a small risk that an individual could still be a carrier. This is called “residual risk.” See table below for residual risks, which presume a negative family history of the disorders listed.
- Consider requesting a referral for genetic counseling. A genetic counselor can further explain the implications of this test result and assess family health history, which may point to health information that merits additional consideration.
- All patients, regardless of result, may wish to consider additional screening for hemoglobinopathies by complete blood count (CBC) and hemoglobin electrophoresis, if not already completed.

Clinical Summary

CARRIER: Cystic fibrosis

A Pathogenic variant, c.1521_1523delCTT (p.Phe508del), was identified in CFTR.

What is cystic fibrosis?

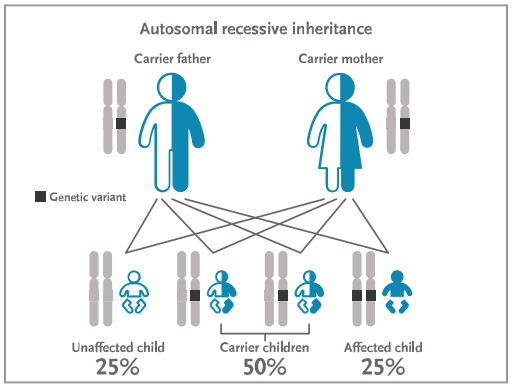
Cystic fibrosis (CF) is typically a childhood-onset condition in which abnormal mucus production causes severe lung disease and nutritional deficiencies. Symptoms range from mild to severe and may include lung disease, pancreatic insufficiency, poor growth, and infertility. In the most severe form of CF, the average life expectancy is 37 years; life span is not typically impacted with less severe forms of CF, which are associated with minimal to no lung or pancreatic involvement. There is currently no cure, but treatments may ease symptoms and reduce complications. Other CFTR-related disorders include congenital absence of the vas deferens (CAVD) causing male infertility, hereditary pancreatitis, and variable respiratory manifestations. Hereditary pancreatitis may develop in childhood or adolescence and may lead to chronic pancreatitis, a known risk factor for pancreatic cancer. Carriers are not affected with cystic fibrosis, though they do have an increased risk for chronic pancreatitis and lung damage (bronchiectasis). Additional genetic and environmental factors are believed to play a role in determining the risk of developing these complex conditions.

Next steps

Carrier testing for the reproductive partner is recommended.

If your partner tests positive:

Cystic fibrosis (CFTR-related) is an autosomal recessive condition. In order for an individual to be affected with an autosomal recessive condition, they must have two disease-causing genetic changes, one in each copy of the CFTR gene. Carriers of the condition, who have only one disease-causing genetic change, typically do not have symptoms. When both reproductive partners are carriers of an autosomal recessive condition, there is a 25% chance for each child to have the condition.



If your partner tests negative:

A negative carrier test result reduces, but does not eliminate, the chance that a person may be a carrier. The risk that a person could still be a carrier, even after a negative test result, is called a residual risk. See the table below for your partner's hypothetical residual risk after testing negative for cystic fibrosis (CFTR-related). The values provided assume a negative family history and the absence of symptoms and are based on the detection rate for the condition as tested at Invitae.

Disease (Inheritance)	Gene	Ethnicity	Carrier Frequency	Carrier Residual Risk
Cystic fibrosis (AR) NM_000492.3	CFTR	African-American Ashkenazi Jewish Asian Caucasian Pan-ethnic	1 in 61 1 in 29 1 in 88 1 in 28 1 in 45	1 in 6000 1 in 2800 1 in 8700 1 in 2700 1 in 4400

Variant details

CFTR, Intron 9, c.1521_1523delCTT (p.Phe508del), heterozygous, PATHOGENIC

- This sequence change deletes 3 nucleotides from exon 11 of the CFTR mRNA (c.1521_1523delCTT). This leads to the deletion of one amino acid residue in the CFTR protein (p.Phe508del) but otherwise preserves the integrity of the reading frame.
- This single amino acid deletion (also known as ΔF508) disrupts protein function and is the most common cause of cystic fibrosis (PMID: 2475911, 15371902, 23974870). For these reasons, it has been classified as Pathogenic.

Residual risk

This table displays residual risks after a negative result for each of the genes and corresponding disorders. The values provided assume a negative family history and the absence of symptoms for each disorder. Residual risk values are provided for disorders when carrier frequency is equal to, or greater than, 1 in 500. For disorders with carrier frequency less than 1 in 500, residual risk is considered to be reduced substantially. When provided, residual risk values are inferred from published carrier frequencies and estimated detection rates are based on testing technologies used at Invitae. Residual risks are provided only as a guide for assessing approximate risk given a negative result; values will vary based on the exact ethnic background of an individual. With individuals of mixed ethnicity, it is recommended to use the highest residual risk estimate. *For any genes marked with an asterisk, an accurate residual risk value could not be calculated due to sample-specific limitations. Refer to the Limitations section below for detailed coverage information.

Disorder (inheritance)	Gene	Ethnicity	Carrier frequency before screening	Carrier residual risk after negative result

Technical methods

- Genomic DNA obtained from the submitted sample is enriched for targeted regions using a hybridization-based protocol, and sequenced using Illumina technology. Unless otherwise indicated, all targeted regions are sequenced with ≥50x depth or are supplemented with additional analysis. Reads are aligned to a reference sequence (GRCh37), and sequence changes are identified and interpreted in the context of a single clinically relevant transcript, indicated below. Enrichment and analysis focus on the coding sequence of the indicated transcripts, 10bp of flanking intronic sequence, and other specific genomic regions demonstrated to be causative of disease at the time of assay design. Promoters, untranslated regions, and other non-coding regions are not otherwise interrogated. Exonic deletions and duplications are called using an in-house algorithm that determines copy number at each target by comparing the read depth for each target in the proband sequence with both mean read-depth and read-depth distribution, obtained from a set of clinical samples. All clinically significant observations are confirmed by orthogonal technologies, except individually validated variants. Confirmation technologies include any of the following: Sanger sequencing, Pacific Biosciences SMRT sequencing, MLPA, MLPA-seq, Array CGH. Array CGH confirmation of NGS CNV calling performed by Invitae Corporation (1400 16th Street, San Francisco, CA 94103, #05D2040778). The following analyses are performed if relevant to the requisition. For GBA, the reference genome has been modified to mask the sites of polymorphic paralog sequence variants (PSVs) in both GBA and GBAP1. If one or more reportable variants is identified (see Limitations), GBA is amplified by long-range PCR; PacBio sequencing of the long-range amplicons is used to confirm the variant. Gene conversion events are flagged by our NGS pipeline and reportable pseudogene-derived variants are identified by long-range PCR of GBA followed by PacBio sequencing of the long-range amplicons. For HBA1/2, the reference genome has been modified to force some sequencing reads derived from HBA1 to align to HBA2, and variant calling algorithms are modified to support an expectation of 4 alleles in these regions. HBA1/2 copy number calling is performed by a custom hypothesis testing algorithm which generates diplotype calls. If sequence data for a sample does not support a unique high confidence match from among hypotheses tested, that sample is flagged for manual review. Copy number variation is only reported for coding sequence of HBA1 and HBA2 and the HS-40 region. This assay does not distinguish among the -α3.7 subtypes, and all -α3.7 variants are called as HBA1 deletions. This assay may not detect overlapping copy gain and copy loss events when the breakpoints of those events are similar. For FMR1, triplet repeats are detected by PCR with fluorescently labeled primers followed by capillary electrophoresis. Based on internal validation data, sizing accuracy is expected to be ±1 for CGG repeat alleles less than or equal to 90 repeat units and ±3 for CGG repeat alleles greater than 90 repeat units. If the two CGG repeats listed are the same, this may indicate that both alleles are the same size or that one allele is the reported size and the other allele is too small to be detected by this analysis. Reference ranges: Normal: <45 CGG repeats, intermediate: 45-54 CGG repeats, premutation: 55-200 CGG repeats, full mutation: >200 repeats. Technical component of confirmatory sequencing is performed by Invitae Corporation ({confirmation_lab}). Variants of uncertain significance are not included in this report; however, if additional evidence becomes available to indicate that a previously uncertain variant is clinically significant, Invitae will update this report and provide notification.
- A portion of the analytic workflow, sequencing of DNA libraries, was performed at the Invitae clinical core sequencing facility (CLIA #None) located at None.
- The following transcripts were used in this analysis: ABCB11 (NM_003742.2), ABCC8 (NM_000352.4), ABCD1 (NM_000033.3), ACAD9 (NM_014049.4), ACADM (NM_000016.5), ACADVL (NM_000018.3), ACAT1 (NM_000019.3), ACOX1 (NM_004035.6), ACSF3 (NM_174917.4), ADA (NM_000022.2), ADAMTS2 (NM_014244.4), ADGRG1 (NM_005682.6), AGA (NM_000027.3), AGL (NM_000642.2), AGPS (NM_003659.3), AGXT (NM_000030.2), AIRE (NM_000383.3), ALDH3A2 (NM_000382.2), ALDOB (NM_000035.3), ALG6 (NM_013339.3), ALMS1 (NM_015120.4), ALPL (NM_000478.5), AMT (NM_000481.3), AQP2 (NM_000486.5), ARG1 (NM_000045.3), ARSA (NM_000487.5), ARSB (NM_000046.3), ASL (NM_000048.3), ASNS (NM_133436.3), ASPA (NM_000049.2), ASS1 (NM_000050.4), ATM (NM_000051.3), ATP6V1B1 (NM_001692.3), ATP7A (NM_000052.6), ATP7B (NM_000053.3), ATRX (NM_000489.4), BBS1 (NM_024649.4), BBS10 (NM_024685.3), BBS12 (NM_152618.2), BBS2 (NM_031885.3), BCKDHA (NM_000709.3), BCKDHB (NM_183050.2), BCS1L (NM_004328.4), BLM (NM_000057.3), BSND (NM_057176.2), BTD (NM_000060.3), CAPN3 (NM_000070.2), CBS (NM_000071.2), CDH23 (NM_022124.5),

- A PMID is a unique identifier referring to a published, scientific paper. Search by PMID at http://www.ncbi.nlm.nih.gov/pubmed.

Technical methods

- An rsID is a unique identifier referring to a single genomic position, and is used to associate population frequency information with sequence changes at that position. Reported population frequencies are derived from a number of public sites that aggregate data from large-scale population sequencing projects, including ExAC (http://exac.broadinstitute.org) and dbSNP (http://ncbi.nlm.nih.gov/SNP).
- A MedGen ID is a unique identifier referring to an article in MedGen, NCBI's centralized database of information about genetic disorders and phenotypes. Search by MedGen ID at http://www.ncbi.nlm.nih.gov/medgen. An OMIM number is a unique identifier referring to a comprehensive entry in Online Mendelian Inheritance of Man (OMIM). Search by OMIM number at http://omim.org/.

Limitations

- This assay achieves >99% sensitivity and specificity for single nucleotide variants and insertions and deletions <15bp indels, based on validation study results. Sensitivity to detect insertions and deletions larger than 15bp but smaller than a full exon may be marginally reduced. Expansions and contractions within trinucleotide repeat regions may not be detected unless specified. Invitae's deletion/duplication analysis determines copy number with high confidence at >95% of targeted exons. This methodology may not detect low-level mosaicism. This report reflects the analysis of an extracted DNA sample. In very rare cases, (circulating hematolymphoid neoplasm, bone marrow transplant, recent blood transfusion) the analyzed DNA may not represent the patient's constitutional genome.
- FMR1: This assay is designed to detect and categorize CGG repeats found at the promoter region of the FMR1 locus for all alleles reported. If two equal alleles are reported, this may indicate that both alleles are the same size, or that one allele is the reported size and the other allele is too small to be detected by this analysis NEB: Deletion/duplication analysis is not offered for exons 82-105. VPS13A: Deletion/duplication analysis is not offered for exons 2-3, 27-28. COL27A1: Deletion/duplication analysis is not offered for exons 46-47. SMN1: Systematic exon numbering is used for all genes, including SMN1, and for this reason the exon typically referred to as exon 7 in the literature (PMID: 8838816) is referred to as exon 8 in this report. This assay unambiguously detects SMN1 exon 8 copy number. The presence of the g.27134T>G variant (also known as c.*3+80T>G) is reported if SMN1 copy number = 2. NBN: Deletion/duplication analysis is not offered for exons 15-16. ALG6: Deletion/duplication analysis is not offered for exons 11-12. TSFM: Sequence analysis not offered for exon 5. COL4A5: Deletion/duplication analysis is not offered for exons 11-12. HBA1/2: This assay is designed to detect deletions and duplications of HBA1 and/or HBA2, resulting from the -alpha20.5, --MED, --SEA, --FIL/--THAI, -alpha3.7, -alpha4.2, anti3.7 and anti4.2. Sensitivity to detect other copy number variants may be reduced. Detection of overlapping deletion and duplication events will be limited to combinations of events with significantly differing boundaries. In addition, deletion of the enhancer element HS40 and the sequence variant, Constant Spring (NM_000517.4:c.427T>C), can be identified by this assay. GBA: c.84dupG (p.Leu29Alafs*18), c.115+1G>A (Splice donor), c.222_224delTAC (p.Thr75del), c.475C>T (p.Arg159Trp), c.595_596delCT (p.Leu199Aspfs*62), c.680A>G (p.Asn227Ser), c.721G>A (p.Gly241Arg), c.754T>A (p.Phe252Ile), c.1226A>G (p.Asn409Ser), c.1246G>A (p.Gly416Ser), c.1263_1317del (p.Leu422Profs*4), c.1297G>T (p.Val433Leu), c.1342G>C (p.Asp448His), c.1343A>T (p.Asp448Val), c.1448T>C (p.Leu483Pro), c.1504C>T (p.Arg502Cys), c.1505G>A (p.Arg502His), c.1603C>T (p.Arg535Cys), c.1604G>A (p.Arg535His) variants only. Sensitivity to detect these variants if they result from complex gene conversion events may be reduced. RPGRIP1L: Sequence analysis not offered for exon 23 USH1C: Deletion/duplication analysis is not offered for exons 5-6. MMADHC: Deletion/duplication analysis is not offered for exons 5-6

Disclaimer

DNA studies do not constitute a definitive test for the selected condition(s) in all individuals. It should be realized that there are possible sources of error. Errors can result from trace contamination, rare technical errors, rare genetic variants that interfere with analysis, recent scientific developments, and alternative classification systems. This test should be one of many aspects used by the healthcare provider to

help with a diagnosis and treatment plan, but it is not a diagnosis itself. This test was developed and its performance characteristics determined by Invitae. It has not been cleared or approved by the FDA. The laboratory is regulated under the Clinical Laboratory Improvement Act (CLIA) as qualified to perform high-complexity clinical tests (CLIA IDs: 05D2040778). This test is used for clinical purposes. It should not be regarded as investigational or for research.
